

# Generative AI

# Generative vs Discriminative Models

generative models: predict joint probability  $P(Y, \mathbf{X})$  (what allows to create new data samples) or directly generate new data samples

or just  $P(\mathbf{X}) \rightarrow$  unsupervised (or self-supervised) learning

discriminative models: predict conditional probability (or probability distribution for regression)  $P(Y|\mathbf{X})$  or directly output (label for classification, real value for regression)

task of generative models more difficult: model full data distribution rather than merely find patterns in inputs to distinguish outputs

discriminative model

generative model

[source](#)

# Data Generation

generative models can be used for discriminative tasks (although potentially inferior to direct discriminative methods)

but generative methods do more than discriminative ones: model full data distribution

→ allows generation of new data samples (can be images, text, video, audio, code like SQL or Python, proteins, materials, time series, structured data, ...)

large (auto-regressive) language models examples of generative models

# Deep Learning for Generative AI

Depending on the application, there are currently two dominant approaches for generative AI:

- text generation: LLMs
- image synthesis: diffusion models (usually conditioned on text by transformers)

note the difference between image synthesis and multimodal understanding in LLMs

# Image Synthesis

idea: generate new images as variations of training data

condition generation on text prompts:  
text-to-image

trade-off between diversity and fidelity

SOTA: (guided) diffusion models

example: DALL-E 2

# Different Models Types for Image Synthesis

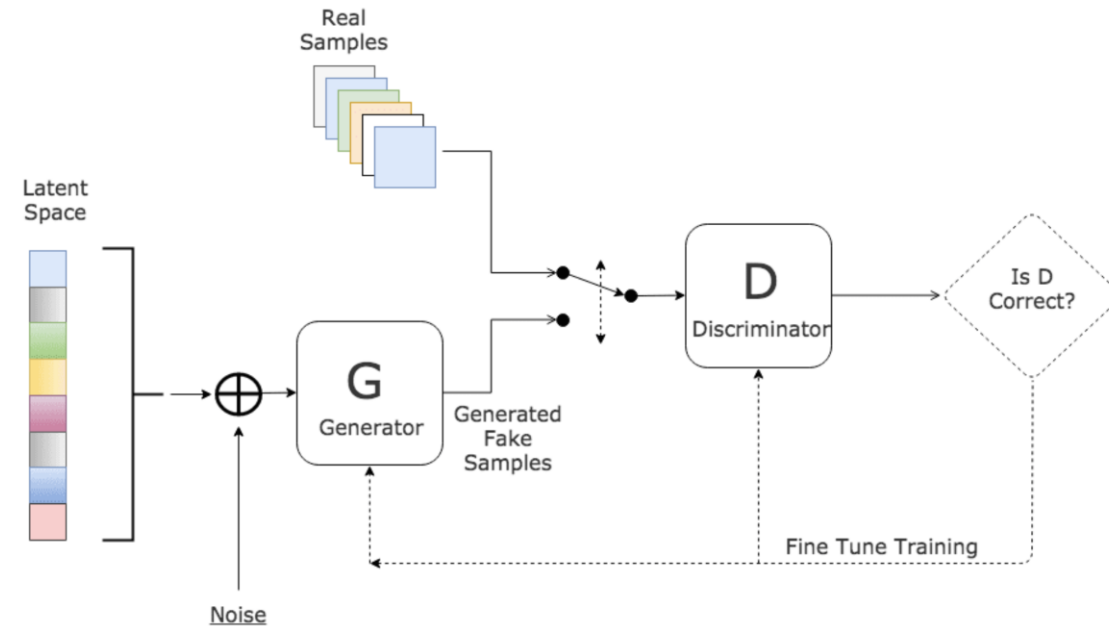

[source](#)

# Generative Adversarial Networks (GAN)

two neural networks playing a zero-sum game:

- the generator network G generating new (fake) samples
- the discriminator network D trying to distinguish between real and fake samples

indirect training via D: G not trained directly to minimize reconstruction error of real samples, but to fool D → self-supervised approach

[source](#)

common loss for generator and discriminator:

$$L(x_i) = E_{x \sim p_r(x)} [\ln D(x_i)] + E_{x \sim p_g(x)} [\ln(1 - D(x_i))]$$

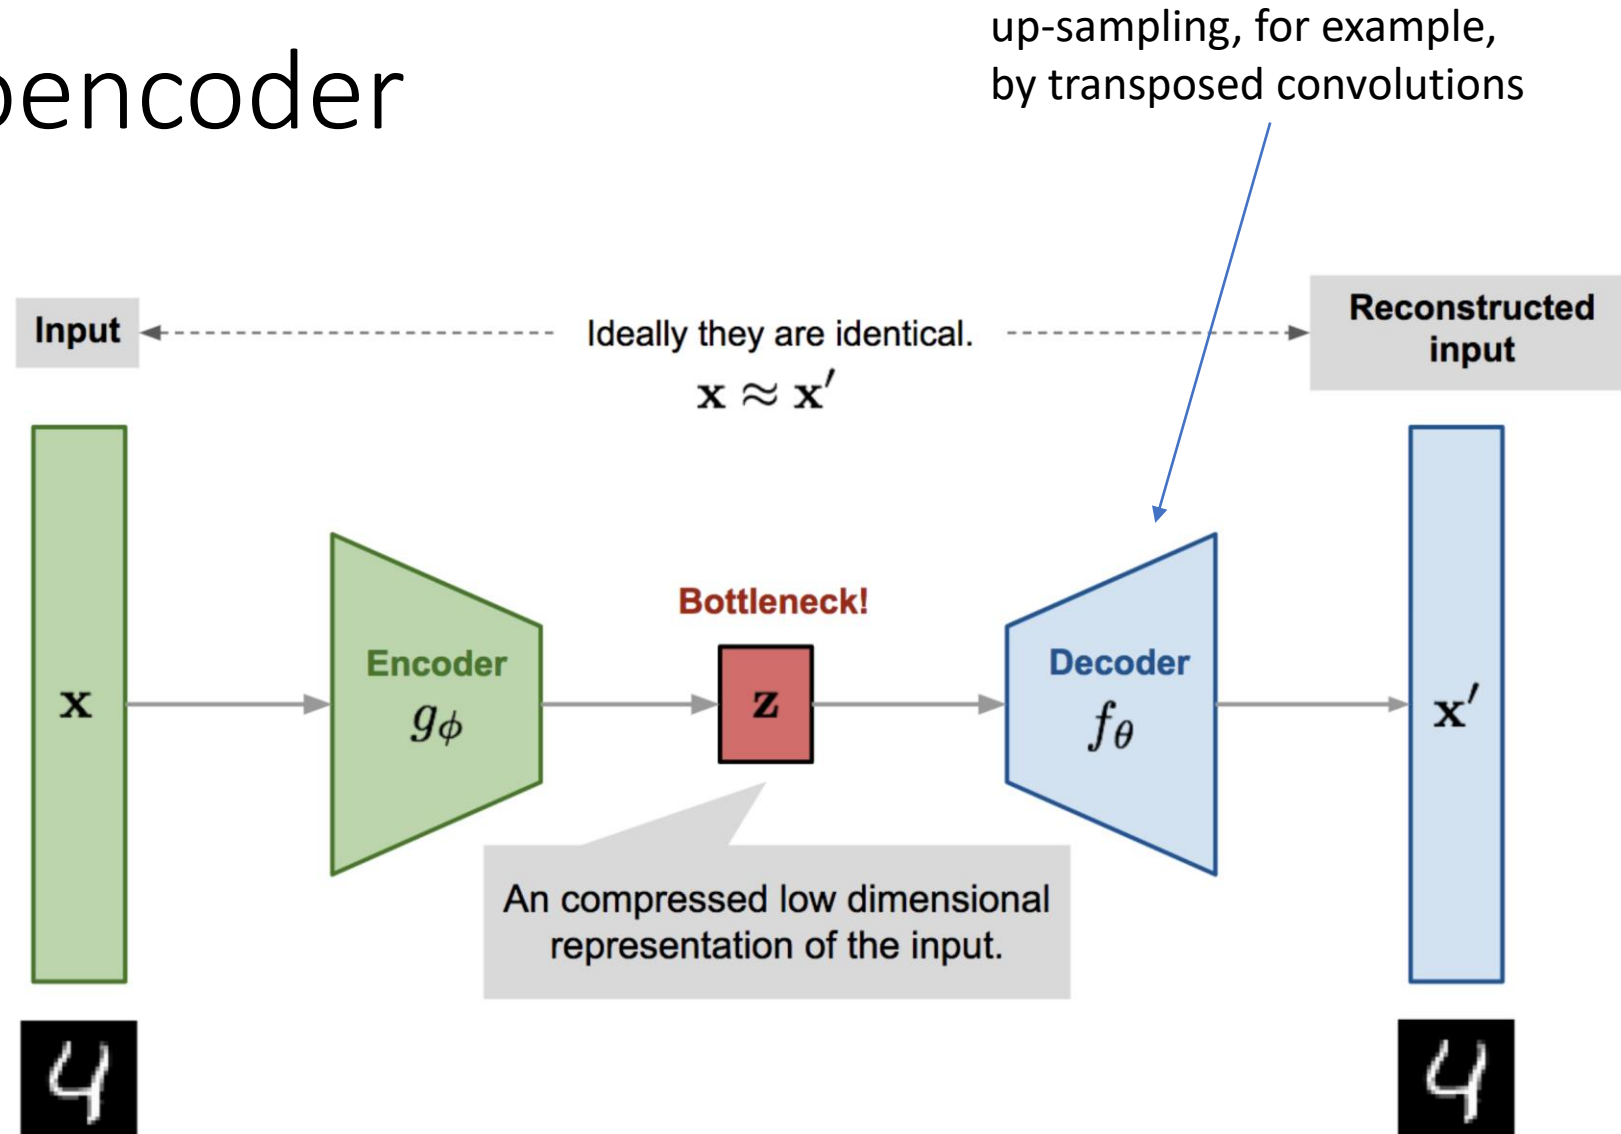

G trying to minimize

D trying to maximize

# Side Note: Autoencoder

(deep) encoder network  
(deep) decoder network  
learned together by  
minimizing differences  
between original input and  
reconstructed input  
(expressed as losses)

compressed intermediate  
representation:  
dimensionality reduction

# Variational Autoencoder (VAE)

goal: generation of variations of input data rather than compressed representation

→ learn variational distribution instead of identity function

to be precise: parametrized variational distribution of latent encoding variables  $\mathbf{z}$

prior (simple distribution, in usual VAE: Gaussian):  $p_{\theta}(\mathbf{z})$

posterior:  $p_{\theta}(\mathbf{z}|\mathbf{x}) = \frac{p_{\theta}(\mathbf{x}|\mathbf{z})p_{\theta}(\mathbf{z})}{\int p_{\theta}(\mathbf{x}|\mathbf{z})p_{\theta}(\mathbf{z})d\mathbf{z}}$

$p_{\theta}(\mathbf{x})$ : mixture of Gaussians

from which to sample

from wikipedia

Variational Bayesian Method

# Gaussian Approximation

learn mean and variance of multivariate Gaussian with diagonal covariance structure

from wikipedia

good approximation:

Posterior and approximation

poor approximation:

Posterior and approximation

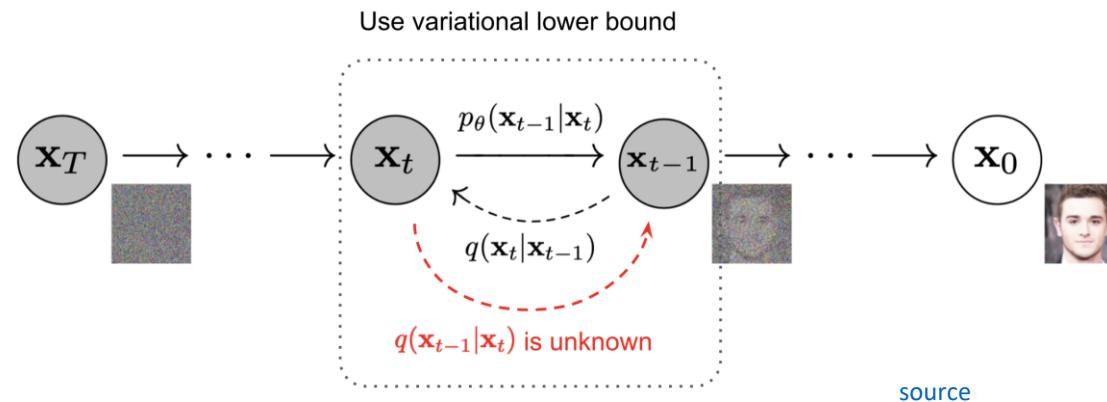

[source](#)

# Diffusion

training: distort training data by successively adding random noise, then learn to reverse this process (denoising)

generation: sample random noise and run through the learned denoising process

advantages: easy to train, produce high-quality/realistic samples

can be interpreted as special case of hierarchical VAE (one latent variable generates another) with fixed encoder and latent space of same size as the data

→ more sophisticated latent space than just Gaussian mixture in VAE

# Text-to-Image

plenty of applications: [DALL-E](#), [Stable Diffusion](#), [ImageGen](#), [Midjourney](#), ...

rather “translations”

also text-to-speech ([VALL-E](#), [Speech T5](#), ...) (and speech recognition, e.g., [Whisper](#)),  
text-to-video ([Make-A-Video](#), [Lumiere](#), [Sora](#), ...) → dynamics/physics understanding/simulation

web app for Stable  
Diffusion: [DreamStudio](#)

inpainting example ([GLIDE](#)):
